

Module description

for the degree programme

Master of Science Clean
Energy Processes

(Version of examination regulation: 20212)

The enclosed module handbook contains both the modules of the specialisation "Energy technologies" and of the specialisation "Energy systems".

- Modules of specialisation "Energy technologies": pages 12 - 68
- Modules of the specialisation "Energy systems" : pages 69 - 115

Table of contents

Advanced seminar (45003).....	5
Internship / practical training on industry (1995).....	6
Master's thesis (1999).....	8
Seminar sustainability and environmental ethics (45002).....	10
Specialisation modules with laboratory course 1-2	
Clean combustion technology with laboratory course (42903).....	13
Photovoltaic systems - Fundamentals with laboratory course (42906).....	15
Power electronics for decentral energy systems with laboratory course (42904).....	17
Thin-film processing with laboratory course (42905).....	19
Specialisation modules 1-4	
Clean combustion technology (42917).....	22
Electrical energy storage systems (42924).....	24
Fuel cells and electrolysers (42918).....	26
Photovoltaic systems - Fundamentals (42923).....	28
Power electronics for decentral energy systems (42919).....	30
Pumps and turbines (42920).....	33
Renewable thermal power plants (42921).....	35
Thin-film processing (42922).....	37
Compulsory elective module 1-3	
Chemical Technologies for the Energy Transition (42939).....	40
Chemical Technologies for the Energy Transition (42940).....	41
Experimental fluid mechanics (42933).....	42
Microfluidics and microfluidic devices (42934).....	44
Particle Technology (42938).....	46
Polymer Recycling (42937).....	48
Polymer science and processing (45375).....	50
Self-organisation processes (42936).....	52
Elective modules from other specialisation 1-2	
Economics of climate change (ECC) (53286).....	55
Efficient heat transfer (42911).....	57
Life cycle assessment (42912).....	59
Phosphors for light conversion in photovoltaic devices and LEDs (42913).....	61
Process control and plant safety (42914).....	63
Process simulation (42915).....	65
Quantitative methods in energy market modelling (52592).....	67
Specialisation modules with laboratory course 1-2	
Phosphors for light conversion in photovoltaic devices and LEDs with laboratory course (42902).....	70
Process control and safety with laboratory course (42901).....	72
Process simulation with laboratory course (42900).....	74
Specialisation modules 1-4	
Economics of climate change (ECC) (53286).....	77
Efficient heat transfer (42911).....	79
Life cycle assessment (42912).....	81
Phosphors for light conversion in photovoltaic devices and LEDs (42913).....	83
Process control and plant safety (42914).....	85
Process simulation (42915).....	87
Quantitative methods in energy market modelling (52592).....	89
Compulsory elective module 1-3	
Biocatalytic energy systems (47756).....	92

Energy process technology (42931).....	93
Polymer Recycling (42937).....	94
Process systems dynamics 2 (42930).....	96
Scientific computing in engineering 2 (42932).....	97
Elective modules from other specialisation 1-2	
Clean combustion technology (42917).....	99
Electrical energy storage systems (42924).....	101
Fuel cells and electrolysers (42918).....	103
Photovoltaic systems - Fundamentals (42923).....	105
Power electronics for decentral energy systems (42919).....	107
Pumps and turbines (42920).....	110
Renewable thermal power plants (42921).....	112
Thin-film processing (42922).....	114

1	Module name 45003	Advanced seminar	5 ECTS
2	Courses / lectures	The teaching units in the module are only offered in the summer semester.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr.-Ing. Andreas Bück
5	Contents	<p>Content</p> <p>In this seminar, presentation and working techniques are demonstrated, with which presentations and the necessary accompanying material can be created.</p> <p>Students use this to create a scientific presentation with accompanying literature based on current, interesting topics within the chosen field of study.</p>
6	Learning objectives and skills	<p>The students</p> <ul style="list-style-type: none"> • can find, analyze and evaluate required literature • work independently into a topic • apply presentation techniques • develop a presentation with accompanying material for a specialist audience • conduct a presentation in the given time frame • discuss issues among experts • are able to work in a goal-oriented manner with fellow students as well as external experts and non-specialist third parties
7	Prerequisites	None
8	Integration in curriculum	semester: 1;2;3;4
9	Module compatibility	Pflichtmodul Master of Science Clean Energy Processes 2012
10	Method of examination	Seminar achievement
11	Grading procedure	Seminar achievement (100%)
12	Module frequency	only in summer semester
13	Workload in clock hours	Contact hours: 30 h Independent study: 120 h
14	Module duration	1 semester
15	Teaching and examination language	english
16	Bibliography	<ul style="list-style-type: none"> • Zanders, E. D., "Presentation skills for scientists : a practical guide", 2nd edition, Cambridge University Press, 2018 • Dionne, J.-P., "Presentation Skills for Scientists and Engineers: The Slide Master", 1st edition, Springer-Verlag, 2021 • Carter, M., "Designing science presentations : a visual guide to figures, papers, slides, posters, and more", 1st edition, Elsevier/AP Verlag, 2013

1	Module name 1995	Internship (M.Sc. Clean Energy Processes 20212) Internship / practical training on industry	10 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator		
5	Contents	<p>The internship is intended to provide an overview of the various activities in a company, a laboratory or research facility in a university or other research institutes through participation in work or project groups. In addition, special skills of engineers are to be acquired, based on the knowledge already acquired in the studies. As a basis for this, the technical and methodological skills acquired in the bachelor's degree are to be implemented. Desirable fields of activity are e.g. energy engineering, chemical engineering, process engineering, electrical engineering, plant engineering and related industries, engineering administration, companies doing research, research institutes or other institutions.</p>	
6	Learning objectives and skills	<p>Students:</p> <ul style="list-style-type: none"> • are familiar with typical tasks in the field of clean energy processes or related industries • know and understand the organization and social structure of an industrial company • recognize the interrelationships between the individual areas of a company or other organisation • apply the specialist knowledge gained so far in the course of their studies in industrial practice • reflect on the impact of their actions on the outcome of the tasks entrusted to them • analyze the knowledge required in industry in comparison with the content of their own studies 	
7	Prerequisites	None	
8	Integration in curriculum	no Integration in curriculum available!	
9	Module compatibility	Pflichtmodul Master of Science Clean Energy Processes 20212	
10	Method of examination	Course achievement/internship achievement: internship	
11	Grading procedure		
12	Module frequency	no Module frequency information available!	
13	Workload in clock hours	<p>Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)</p>	
14	Module duration	?? semester (no information for Module duration available)	

15	Teaching and examination language	english
16	Bibliography	

1	Module name 1999	Master's thesis (M.Sc. Clean Energy Processes 20212) Master's thesis	30 ECTS
2	Courses / lectures	No courses / lectures available for this module!	
3	Lecturers	No lecturers available since there are no courses / lectures for this module!	

4	Module coordinator		
5	Contents	<p>Independent work on a scientific problem in the field of clean energy processes, depending on their specialisation in one of the following fields:</p> <ul style="list-style-type: none"> • Energy technologies • Energy systems • Electrical Energy engineering • Materials science and engineering • Process engineering <p>The thesis must be done in either the specializations "Energy Technologies" or "Energy Systems". Furthermore, the topic of the Master's thesis can also be issued by a university lecturer working full-time at the Friedrich-Alexander Universität Erlangen-Nürnberg who is responsible for one of the modules M1 to M6.</p>	
6	Learning objectives and skills	<p>Students</p> <ul style="list-style-type: none"> • are able to work independently on a scientific problem from a selected area of the study field clean energy processes within a given time limit • develop independent ideas and concepts to solve scientific problems • deal with theories, terminologies, specifics, limitations and doctrines of the subject in an in-depth and critical way and reflect on them • can apply and further develop suitable scientific methods largely independently - also in new and unfamiliar as well as interdisciplinary contexts - as well as present the results in a scientifically appropriate form. • can present subject-related content clearly and appropriately to the target group, both orally and in writing, and argue the case for it • expand their planning and structuring skills in the implementation of a thematic project. 	
7	Prerequisites	<p>Admission requirements for the Master thesis are the acquisition of at least 90 ECTS credits (see programme regulation FPO CEP section 49 (1)). The Master's thesis shall be written in English (see section 49 FPO CEP).</p>	
8	Integration in curriculum	no Integration in curriculum available!	

9	Module compatibility	Pflichtmodul Master of Science Clean Energy Processes 20212
10	Method of examination	Oral (30 minutes) Written (6 Monate)
11	Grading procedure	Oral (10%) Written (90%) The master thesis and its results have to be presented in a presentation of max. 30 minutes followed by a discussion. The master thesis is worth 27 ECTS credits, the presentation 3 ECTS credits (see FPO CEP section 50 (2)).
12	Module frequency	no Module frequency information available!
13	Resit examinations	The exams of this moduls can only be resit once.
14	Workload in clock hours	Contact hours: ?? h (keine Angaben zum Arbeitsaufwand in Präsenzzeit hinterlegt) Independent study: ?? h (keine Angaben zum Arbeitsaufwand im Eigenstudium hinterlegt)
15	Module duration	?? semester (no information for Module duration available)
16	Teaching and examination language	german
17	Bibliography	

1	Module name 45002	Seminar sustainability and environmental ethics	5 ECTS
2	Courses / lectures	Seminar: Sustainability and Environmental Ethics (4 SWS)	5 ECTS
3	Lecturers	Prof. Dr. Martin Hartmann Prof. Dr.-Ing. Jürgen Karl	

4	Module coordinator	Prof. Dr. Martin Hartmann Prof. Dr.-Ing. Jürgen Karl
5	Contents	This course introduces the academic approach of sustainability and environmental ethics. It explores how today's human societies can endure in the face of global change, ecosystem degradation and resource limitations. The course focuses on key knowledge areas of sustainability theory and practice, including population, ecosystems, global change, energy, agriculture, water, circular economy, environmental economics and policy, ethics, and cultural history.
6	Learning objectives and skills	Students will become familiar with important concepts of sustainability and environmental ethics and discuss current possibilities, limitations and future challenges. Students who successfully participate in this module can: <ul style="list-style-type: none"> • Understand the concept and methodology of sustainability and environmental ethics • Apply the methodology of green chemistry and engineering • Identify opportunities for improvements by life cycle sustainability assessments (LCSA) • Collect information on topics of current interest and present the results to the course members orally or in writing • Explain and discuss important new concepts (e.g. planetary boundaries, geoengineering, eco-sufficiency, rebound effect)
7	Prerequisites	None
8	Integration in curriculum	semester: 1;2;3;4
9	Module compatibility	Pflichtmodul Master of Science Clean Energy Processes 2012
10	Method of examination	Seminar achievement
11	Grading procedure	Seminar achievement (100%)
12	Module frequency	only in winter semester
13	Workload in clock hours	Contact hours: 60 h Independent study: 90 h

1	Module name 42906	Photovoltaic systems - Fundamentals with laboratory course	7,5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Advanced Semiconductor Technologies - Photovoltaic Systems for Power Generation - Design Implementation and Characterization (2 SWS)	3 ECTS
		Praktikum: Lab Work Characterization and Advanced Defect Imaging of PV Modules and Systems (3 SWS)	2 ECTS
		Übung: Exercises Photovoltaic systems Fundamentals (CEP) (Ex-PVS-F) (3 SWS)	2 ECTS
3	Lecturers	Prof. Dr. Christoph Brabec Dr. Karen Forberich	

4	Module coordinator	Prof. Dr. Christoph Brabec	
5	Contents	The lecture will introduce the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies of today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture, exercises and the lab works.	
6	Learning objectives and skills	<ul style="list-style-type: none"> The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen. 	
7	Prerequisites	Prerequisites: Bachelor in Material Science, Nanotechnology, Energy Technology, Electronic Engineering, Computer Science, Physics, Chemistry, Chemical Engineering, Nanotechnologie, Energietechnik, Elektrotechnik, Physik, Chemie or comparable	
8	Integration in curriculum	semester: 1;2;3;4

5	Contents	<p>Content:</p> <p>Introduction to electric energy storage systems and their applications regarding the mode of operation and load scenarios in mobile and stationary applications</p> <ul style="list-style-type: none"> Basics on electrochemical and physical energy storage systems as well as the used electronics for measuring (e.g. battery management system (BMS)) and connecting the storage to the source or load (e.g. power electronic). Different electrochemical storage systems (Pb, NiCd, NiMH, NaNiCl₂, Lilo), fuel cells, flywheels, capacitors and thermal storages Basics on analytic calculations of necessary ratings for mobile an stationary applications according to capacity, charge and discharge power, losses and lifetime Safety aspects using energy storage systems 	
6	Learning objectives and skills	<p>Students who participate in this course get basic knowledge on the use and selection of different electric energy storage systems. Therefore the most common used electrochemical storage systems are presented and the specific properties are discussed. Further on storage solutions based on capacitors, flywheels and fuel cells are covered. The basic electric performance and the system behavior is described. For different applications the students learn to specify the necessary requirements, to work with available datasheets and to configure electric storage systems.</p>	
7	Prerequisites	<p>Prerequisites:</p> <p>To succeed in this course, students will need basic knowledge in chemistry and electronics.</p>

4	Module coordinator	Prof. Dr. Christoph Brabec	
5	Contents	The lecture will introduce to the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies of today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture and exercises.	
6	Learning objectives and skills	<ul style="list-style-type: none"> The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen. 	
7	Prerequisites	None

3	Lecturers	Prof. Dr.-Ing. Michael Wensing Tatiana Weiß Prof. Dr. Klaus Riedle	

4	Module coordinator	Dr.-Ing. Sebastian Rieß Prof. Dr.-Ing. Michael Wensing
5	Contents	<p>Content: Thermodynamic basics, primary energy situation worldwide, sustainable energy resources, CO2 capture and storage, CO2-free energy sources and processes (water, wind, biomass, geothermal energy, photovoltaics), energy management (energy demand, energy reserves, primary energy sources, environmental impact, sustainable and fossil power plant types in comparison; thermal cycle processes (steam turbines, gas turbines, engines, combined processes); renewable power plants, effects of sustainable energy sources on the machine design in power plants, energy economics, efficient usage, energy storage, electro-chemical power processes, climate change, renewable energies</p> <p>Description of the exercise: The exercise programme, which is scheduled with 3 SWS, is conducted in seminar form. Participants are divided into groups that work together on a project on regenerative energy supply. Project contents can be, for example, concepts for CO2 reduction for a neighbourhood, a city, region or a larger industrial company. The exercise is accompanied as a project course by experienced experts from industry who are available to the students for discussion. Meetings take place weekly during the exercise times. As a result, the project groups submit a report on their findings and give a final presentation. These two performances together constitute the students' examination performance. There is no separate examination.</p>
6	Learning objectives and skills	<p>Students who successfully participate in this module:</p> <ul style="list-style-type: none"> • know technologies and components of power plant engineering • have a fundamental overview of energy-economic issues in power plant technology • are able to analyze energy conversion processes for the generation of power and electrical energy in thermal and other power plants • can understand the technical implementation of power plants and develop and evaluate proposals for optimization • apply thermodynamic principles for process optimization and can further develop these methods for process optimization

		<ul style="list-style-type: none"> • discuss alternative solutions for energy production with regard to sustainability and environmental protection • have an overview of the possibilities of CO₂-free energy production and can evaluate energy sources and energy processes under aspects of sustainability and environmental impact
7	Prerequisites	To succeed in this course, students will need to apply acquired knowledge from basics in process engineering especially engineering thermodynamics and principles of transport. Basic knowledge in general chemistry is beneficial.

3	Lecturers	Dr. Jochen Schmidt	

4	Module coordinator	Dr. Jochen Schmidt
5	Contents	<ul style="list-style-type: none"> • Introduction to polymer recycling and the circular economy of plastics (definitions, basic concepts, plastic wastes as a valuable and sustainable resource, challenges) • Collection and sorting of plastic wastes (collection schemes, (fundamentals of) separation and classification processes, sorting and recycling plants) • Chemical recycling of plastics (solvolysis, thermolysis, pyrolysis) • Mechanical recycling of thermoplasts (extrusion, injection moulding, examples (primary recycling of polyethyleneterephthalate, secondary recycling of polyolefins etc.)) • Thermoplast recyclates –additive enhancement and challenges in processing (compatibilizers, antioxidants etc.) • ‘Thermal recycling’ of waste streams • Recycling of fiber-enhanced composites (cf. rotor blades • Trends towards more sustainable plastics – recent innovations in polymer recycling, recycling of biopolymers?
6	Learning objectives and skills	<p>This module aims to provide an introduction into the state of the art of plastic recycling. Current regulations in plastic waste management throughout the world, as well as the demands towards more sustainable plastics and the transition to a circular economy pose many challenges in collection and sorting of plastics wastes and their conversion to (processable) recyclates. This course will provide the concepts of collection and sorting of plastic wastes as well as the basics of chemical, mechanical recycling and thermal conversion of plastic waste streams.</p> <p>The students will learn to understand ‘plastic wastes’ as a sustainable resource for the plastics and chemical industries. Moreover, they will be able to assess the most useful recycling approach for a certain waste stream depending on composition and degree of contamination. In the context of mechanical recycling of thermoplasts, the students will be able to assess viable strategies of additive enhancement of recyclates to cope with the challenges in processing.</p>
7	Prerequisites	<p><u>Required</u> (General) chemistry, basics of organic chemistry Polymer Science and Processing</p> <p><u>Recommended</u> Materials and Structure Polymer Science and Processing Life Cycle Assessment</p>

Elective modules from other specialisation 1-2

1	Module name 53286	Economics of climate change (ECC)	5 ECTS
2	Courses / lectures	Übung: Economics of Climate Change (ECC) (2 SWS) Vorlesung: Economics of Climate Change (ECC) (2 SWS)	- 5 ECTS
3	Lecturers	Dr. Jonas Egerer Prof. Dr. Veronika Grimm	

4	Module coordinator	Dr. Jonas Egerer Nima Farhang-Damghani Prof. Dr. Veronika Grimm
5	Contents	<p>This course focuses on the interactions between society, the economy and climate change: one of the greatest challenges of our time. The course will discuss the origin of environmental challenges, technological options for their solution and policies to promote the transformation to a climate neutral economy and society. The following issues will be covered:</p> <ul style="list-style-type: none"> • Welfare economics and the environment • Externalities and origins of the sustainability problem • Climate change and the greenhouse gas effect • Global climate scenarios • Economics of low-carbon technologies • Global and regional low carbon scenarios • Measures of climate resilience • Pollution control: Targets and policy instruments • International Cooperation: Kyoto Protocol and Paris Agreement • Applications of Climate Policy: EU-ETS and national CO2-tax • Case studies for the energy, heat and mobility sector
6	Learning objectives and skills	<p>Students who participate in this course will become familiar with the physical science basis of climate change, economic concepts for the allocation of public goods, scenarios for low-carbon energy systems from a technological and an economic perspective, and policy instruments to reduce greenhouse gas emissions.</p> <p>Students who successfully participate in this module can:</p> <ul style="list-style-type: none"> • Explain the physical basics of climate change • Understand economic concepts for public goods • Compare different low-carbon technologies • Describe pathways towards sustainable energy systems • Develop an understanding of climate resilience • Discuss different policy instruments • Understand the EU-ETS and national carbon taxes • Develop sector specific scenarios in case studies
7	Prerequisites	To succeed in this course, students will need to apply acquired knowledge from e.g. economics and mathematics.
8	Integration in curriculum	semester: 1

9	Module compatibility	Elective modules from other specialisation 1-2 Master of Science Clean Energy Processes 20212 Specialisation modules 1-4 Master of Science Clean Energy Processes 20212

3	Lecturers	-	

4	Module coordinator	Prof. Dr. Karl Gregor Zöttl	
5	Contents	<p>It is the purpose of the course to understand and quantitatively analyse the economic interaction of the players and institutions in liberalized energy markets.</p> <p>Liberalized electricity markets can be segmented in a regulated part (the networks) and the non-regulated parts (generation and retail) where private companies interact in a market environment. The interaction of the different agents is analysed with computational equilibrium frameworks based the concepts applied in industrial organization. Next to the fundamental understanding of the relevant market interaction, the models allow for a quantitative analysis of proposals for the design of energy markets. The participants thus develop the tools for an autonomous assessment of currently discussed policies in liberalized electricity markets (e.g. changed support schemes for renewables, changed network tariff systems, impact of capacity markets).</p> <p>The course aims at students in the field of economics /business as well as students in the fields of engineering and mathematics. An integral part of the course id formed by homework assignments conducted in groups. The ability to cooperate also beyond the classical limits of each discipline is an important qualification for the students careers, which should be stimulated in the context of this course.</p>	
6	Learning objectives and skills	<p>The students:</p> <ul style="list-style-type: none"> • develop a clear picture of the relevant market participants in liberalized electricity markets and understand their incentives and objectives • learn fundamental concepts and models which allow to analyze the interaction at those markets • get to know important publically available data sources which allow for a quantitative analysis of the market situations considered • know the current challenges when designing those markets and can quantitatively analyze the solutions proposed in the current policy debate. 	
7	Prerequisites	<p>The students should be familiar with the mathematical methods acquired during their Bachelor degree.</p> <p>Institutional knowledge of electricity markets is not required.</p>

Specialisation modules 1-4

1	Module name 53286	Economics of climate change (ECC)	5 ECTS
2	Courses / lectures	Übung: Economics of Climate Change (ECC) (2 SWS) Vorlesung: Economics of Climate Change (ECC) (2 SWS)	- 5 ECTS
3	Lecturers	Dr. Jonas Egerer Prof. Dr. Veronika Grimm	

4	Module coordinator	Dr. Jonas Egerer Nima Farhang-Damghani Prof. Dr. Veronika Grimm
5	Contents	<p>This course focuses on the interactions between society, the economy and climate change: one of the greatest challenges of our time. The course will discuss the origin of environmental challenges, technological options for their solution and policies to promote the transformation to a climate neutral economy and society. The following issues will be covered:</p> <ul style="list-style-type: none"> • Welfare economics and the environment • Externalities and origins of the sustainability problem • Climate change and the greenhouse gas effect • Global climate scenarios • Economics of low-carbon technologies • Global and regional low carbon scenarios • Measures of climate resilience • Pollution control: Targets and policy instruments • International Cooperation: Kyoto Protocol and Paris Agreement • Applications of Climate Policy: EU-ETS and national CO2-tax • Case studies for the energy, heat and mobility sector
6	Learning objectives and skills	<p>Students who participate in this course will become familiar with the physical science basis of climate change, economic concepts for the allocation of public goods, scenarios for low-carbon energy systems from a technological and an economic perspective, and policy instruments to reduce greenhouse gas emissions.</p> <p>Students who successfully participate in this module can:</p> <ul style="list-style-type: none"> • Explain the physical basics of climate change • Understand economic concepts for public goods • Compare different low-carbon technologies • Describe pathways towards sustainable energy systems • Develop an understanding of climate resilience • Discuss different policy instruments • Understand the EU-ETS and national carbon taxes • Develop sector specific scenarios in case studies
7	Prerequisites	To succeed in this course, students will need to apply acquired knowledge from e.g. economics and mathematics.
8	Integration in curriculum	semester: 1

9	Module compatibility	Elective modules from other specialisation 1-2 Master of Science Clean Energy Processes 20212 Specialisation modules 1-4 Master of Science Clean Energy Processes 20212

1	Module name 52592	Quantitative methods in energy market modelling	5 ECTS
2	Courses / lectures	The teaching units in the module are only offered in the summer semester.	
3	Lecturers	-	

4	Module coordinator	Prof. Dr. Karl Gregor Zöttl	
5	Contents	<p>It is the purpose of the course to understand and quantitatively analyse the economic interaction of the players and institutions in liberalized energy markets.</p> <p>Liberalized electricity markets can be segmented in a regulated part (the networks) and the non-regulated parts (generation and retail) where private companies interact in a market environment. The interaction of the different agents is analysed with computational equilibrium frameworks based the concepts applied in industrial organization. Next to the fundamental understanding of the relevant market interaction, the models allow for a quantitative analysis of proposals for the design of energy markets. The participants thus develop the tools for an autonomous assessment of currently discussed policies in liberalized electricity markets (e.g. changed support schemes for renewables, changed network tariff systems, impact of capacity markets).</p> <p>The course aims at students in the field of economics /business as well as students in the fields of engineering and mathematics. An integral part of the course id formed by homework assignments conducted in groups. The ability to cooperate also beyond the classical limits of each discipline is an important qualification for the students careers, which should be stimulated in the context of this course.</p>	
6	Learning objectives and skills	<p>The students:</p> <ul style="list-style-type: none"> • develop a clear picture of the relevant market participants in liberalized electricity markets and understand their incentives and objectives • learn fundamental concepts and models which allow to analyze the interaction at those markets • get to know important publically available data sources which allow for a quantitative analysis of the market situations considered • know the current challenges when designing those markets and can quantitatively analyze the solutions proposed in the current policy debate. 	
7	Prerequisites	<p>The students should be familiar with the mathematical methods acquired during their Bachelor degree.</p> <p>Institutional knowledge of electricity markets is not required.</p>	
8	Integration in curriculum	semester: 1;2;3;4	
9	Module compatibility	<p>Elective modules from other specialisation 1-2 Master of Science Clean Energy Processes 20212</p> <p>Specialisation modules 1-4 Master of Science Clean Energy Processes 20212</p>

1	Module name 42937	Polymer Recycling	5 ECTS
2	Courses / lectures	Vorlesung mit Übung: Polymer Recycling (SWS)	-
3	Lecturers	Dr. Jochen Schmidt	

4	Module coordinator	Dr. Jochen Schmidt
5	Contents	<ul style="list-style-type: none"> • Introduction to polymer recycling and the circular economy of plastics (definitions, basic concepts, plastic wastes as a valuable and sustainable resource, challenges) • Collection and sorting of plastic wastes (collection schemes, (fundamentals of) separation and classification processes, sorting and recycling plants) • Chemical recycling of plastics (solvolysis, thermolysis, pyrolysis) • Mechanical recycling of thermoplasts (extrusion, injection moulding, examples (primary recycling of polyethyleneterephthalate, secondary recycling of polyolefins etc.)) • Thermoplast recyclates –additive enhancement and challenges in processing (compatibilizers, antioxidants etc.) • ‘Thermal recycling’ of waste streams • Recycling of fiber-enhanced composites (cf. rotor blades • Trends towards more sustainable plastics – recent innovations in polymer recycling, recycling of biopolymers?
6	Learning objectives and skills	<p>This module aims to provide an introduction into the state of the art of plastic recycling. Current regulations in plastic waste management throughout the world, as well as the demands towards more sustainable plastics and the transition to a circular economy pose many challenges in collection and sorting of plastics wastes and their conversion to (processable) recyclates. This course will provide the concepts of collection and sorting of plastic wastes as well as the basics of chemical, mechanical recycling and thermal conversion of plastic waste streams.</p> <p>The students will learn to understand ‘plastic wastes’ as a sustainable resource for the plastics and chemical industries. Moreover, they will be able to assess the most useful recycling approach for a certain waste stream depending on composition and degree of contamination. In the context of mechanical recycling of thermoplasts, the students will be able to assess viable strategies of additive enhancement of recyclates to cope with the challenges in processing.</p>
7	Prerequisites	<p><u>Required</u> (General) chemistry, basics of organic chemistry Polymer Science and Processing</p> <p><u>Recommended</u> Materials and Structure Polymer Science and Processing Life Cycle Assessment</p>

5	Contents	<p>Content:</p> <p>Introduction to electric energy storage systems and their applications regarding the mode of operation and load scenarios in mobile and stationary applications</p> <ul style="list-style-type: none"> Basics on electrochemical and physical energy storage systems as well as the used electronics for measuring (e.g. battery management system (BMS)) and connecting the storage to the source or load (e.g. power electronic). Different electrochemical storage systems (Pb, NiCd, NiMH, NaNiCl₂, Lilo), fuel cells, flywheels, capacitors and thermal storages Basics on analytic calculations of necessary ratings for mobile an stationary applications according to capacity, charge and discharge power, losses and lifetime Safety aspects using energy storage systems 	
6	Learning objectives and skills	<p>Students who participate in this course get basic knowledge on the use and selection of different electric energy storage systems. Therefore the most common used electrochemical storage systems are presented and the specific properties are discussed. Further on storage solutions based on capacitors, flywheels and fuel cells are covered. The basic electric performance and the system behavior is described. For different applications the students learn to specify the necessary requirements, to work with available datasheets and to configure electric storage systems.</p>	
7	Prerequisites	<p>Prerequisites:</p> <p>To succeed in this course, students will need basic knowledge in chemistry and electronics.</p>

4	Module coordinator	Prof. Dr. Christoph Brabec	
5	Contents	The lecture will introduce to the fundamentals of photovoltaic energy conversion. The conversion of light into electricity is one of the most efficient power technologies of today and is expected to transform our energy system towards a renewable scenario. The limits of photovoltaic energy conversion, the materials and architectures of major PV technologies and advanced characterization methods for modules as well as solar fields will be introduced theoretically and experimentally during the lecture and exercises.	
6	Learning objectives and skills	<ul style="list-style-type: none"> The students will learn the concept of black body radiation and the radiation laws and the limits of light energy conversion. The fundamental semiconductor junctions (p-n, M-i-M, Schottky and Hetero Junction) are repeated. The one diode and two diodes replacement circuits are explained. Electrical, optical, recombination and extraction loss mechanisms are discussed separately and demonstrated at the hand of numerical drift-diffusion equation solvers. The most important solar cell concepts (Si, CIGS, CdTe, GaAs, Perovskites, Organics) are introduced, and the strengths and weaknesses of each technology are analysed. Characterization of Photovoltaic Modules will be trained by flashed measurements in the lab. Defect imaging methods like DLIT, EL or PL imaging will be trained at the hand of module installations in Erlangen.

4	Module coordinator	Dr.-Ing. Sebastian Rieß Prof. Dr.-Ing. Michael Wensing
5	Contents	<p>Content: Thermodynamic basics, primary energy situation worldwide, sustainable energy resources, CO2 capture and storage, CO2-free energy sources and processes (water, wind, biomass, geothermal energy, photovoltaics), energy management (energy demand, energy reserves, primary energy sources, environmental impact, sustainable and fossil power plant types in comparison; thermal cycle processes (steam turbines, gas turbines, engines, combined processes); renewable power plants, effects of sustainable energy sources on the machine design in power plants, energy economics, efficient usage, energy storage, electro-chemical power processes, climate change, renewable energies</p> <p>Description of the exercise: The exercise programme, which is scheduled with 3 SWS, is conducted in seminar form. Participants are divided into groups that work together on a project on regenerative energy supply. Project contents can be, for example, concepts for CO2 reduction for a neighbourhood, a city, region or a larger industrial company. The exercise is accompanied as a project course by experienced experts from industry who are available to the students for discussion. Meetings take place weekly during the exercise times. As a result, the project groups submit a report on their findings and give a final presentation. These two performances together constitute the students' examination performance. There is no separate examination.</p>
6	Learning objectives and skills	<p>Students who successfully participate in this module:</p> <ul style="list-style-type: none"> • know technologies and components of power plant engineering • have a fundamental overview of energy-economic issues in power plant technology • are able to analyze energy conversion processes for the generation of power and electrical energy in thermal and other power plants • can understand the technical implementation of power plants and develop and evaluate proposals for optimization • apply thermodynamic principles for process optimization and can further develop these methods for process optimization

		<ul style="list-style-type: none"> • discuss alternative solutions for energy production with regard to sustainability and environmental protection • have an overview of the possibilities of CO₂-free energy production and can evaluate energy sources and energy processes under aspects of sustainability and environmental impact
7	Prerequisites	To succeed in this course, students will need to apply acquired knowledge from basics in process engineering especially engineering thermodynamics and principles of transport. Basic knowledge in general chemistry is beneficial.
